OHIO APPLICATOR FORECAST WEBSITE

To assist farmers in proper nutrient placement, the Ohio Applicator Forecast Website was launched in May 2017. The forecast is designed to help nutrient applicators identify times when the weather-risk for applying is low.

The risk forecast is part of a regional Runoff Risk Decision Support project. Wisconsin, Michigan, Minnesota, and Ohio have partnered with several federal agencies and educational institutions to develop the decision-support tools. In Ohio, the project is a collaboration of the Ohio Department of Agriculture, the National Weather Service, USDA's Agricultural Research Service, the Ohio State University, and the Great Lakes Restoration Initiative.
