

OHIO: WATERSHED PLANS WITH FAR-FIELD PHOSPHORUS TARGETS

Watershed planning helps identify critical areas, set local goals, and coordinate implementation of conservation practices. Development of new plans are underway in 26 HUC12 Maumee River watersheds to identify load reduction opportunities and establish far-field phosphorus targets at the watershed level. Far-field planning efforts look to meet overarching Annex 4 nutrient reduction goals, rather than goals for localized impairments. Existing plans will be updated to incorporate far-field phosphorus targets. In 2020, the Great Lakes Restoration Initiative has funded \$187,810 for watershed planning in Ohio.
